

Pour concrete in the direction of arrows A & B only

- Unroll vapor retarder over compacted sub-base with longest dimension of roll parallel to the direction of pour.
- Ensure top layer is always overlapping bottom layer.
- Overlap any joints/seams a minimum of 6".
- Secure any and all joint, seams, and overlaps with approved tape.
- Repair or seal any holes, damage, penetrations, and openings through vapor retarder including plumbing systems, piping, and conduit.
- Pour concrete over the vapor retarder in the same direction as it was rolled out so that concrete works its way over the top of the sheets and cannot work its way between the adjacent sheets.
