Product description:

The product presented for testing is a molded part made of cement-based fiber composite material for use in the building industry, such as terraces, balconies, garages, sidewalks, sports facilities, driveways, workshops, pedestrian zones and similar areas. They are used for surface water management and drainage in the aforementioned areas.

The composite material consists of a mixture of fibres, cement and aggregates. The process enables the production of thin-walled and light cross-sections with high strength and rigidity.
